Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a
scree greater than or equal to the scree of the result being printed,
and is derived by analysis of the total score distribution.

ECORI; isolate: 28p2; cDNA was prepared from polyymenriche RNA The CNNA was ligated into Lambad gill from Strategene and packaged using Glapack packaging extracts. An aliquot of the amplified library was used to transduce Lecol #1090 and phace DNA was used for transduce lysate. The CNNA inserts were gel purified from a liquid digestion and ligated into pBluescript SK; aliquots of the ligation were used to transform E. Coll DHSalpha which were plated onto medium with X-gal for selection of

Frimers (see AMT90410) are provided for the present in the principle of the present contained from a test M: tuberculosis strain and further principle gene from a test M: tuberculosis strain have determination of the susceptibility to the strain. (Updated on 25-AMX-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Determining susceptibility of Mycobacterium tuberculosis strains to isoniazid - by detecting mutation(s) in the catalase-peroxide gene,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NX E
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention realtes to a novel method of detecting Mycobacterium buberculosis. The method comprises amplifying the DMA in the samples to generate a detectable amount of amplified DMA comprising a catalase.

Derivate (Rato) DMA fragment with sequence of bases 904-1523 of the PMA tuberculosis strain H37Rw MC katG gene sequence. The method optionally current comprises determining if the AtC DMA fragment has a serine to threonine mutation in code of 15 (8313T mutation). Indicative of an color of intended (IMH) resistant W. tuberculosis strain. The method can be used dydrated (IMH) resistant W. tuberculosis ration. The method can be used to detect W. tuberculosis in biological fuluis, composed the man sputum useful to disquose tuberculosis. This disease is a major cause of human morbidity and mortality, and conclusive disquosis and subsequent treatment depends on identification of the attologic agent W. tuberculosis. The intended allows such drug resistant strains have amerged; the method allows such drug resistant strains to be identified. The present sequence represents the wild-type M. tuberculosis kate of product.

WPI; 1998-086953/08. N-PSDB; AAV06554 New bacterial catalases, related nucleic acid vectors and transformed cells - used as oxidising agents and for detecting destroying hydrogen peroxide, e.g. in blosensors

ö

Claim 1; Fig 1; 35pp; English.

The present sequence is of the Alcaligenes aquamarinus catalase-64CA2. Outsiaes-64CA2 may be used to catalyse ordistion reactions such as epoxidation or hydroxylation. The enzyme can also be used to detect destroy hydrogen perzitle. 9, in connection with 91/xxylla scid perduction. Dioesnors, contact a season to perpending the perduction of dairy products. An intendist stated against partial and purification of calls containing the purification of calls containing the purification of calls containing the encoding catalase-64CA2 can be used to accept the production and purification of calls containing the enzyme. Fragments of the gene encoding catalase-64CA2 can be used to identify related sequences.

This invention relates to the DNA and protein sequences of a novel control and acadase polypertide. The protein of the invention or its homologue is useful for catalysing the broakdown of hydrogen peroxide. The protein sequence of the invention is useful for modifying amail conclosules, by mixing the protein or its fragments with a small molecule. The protein of the invention is also useful for catalysing blochemical reactions, for hydrolysing a slow side of the invention is a solice useful for catalysing blochemical reactions, for hydrolysing specifically to the protein. The nuclects acid sequences of the specifically to the protein. The nuclect acid sequences of the sections is useful as a probe to determine whether a blockpical sample, such as a soll sample, contains an organism having the nuclect acid or such as a soll sample, contains an organism having the nuclect acid or such as a soll sample, contains an organism having the nuclect acid or such as a bold such as useful in immunooff finity charactography. Procedures to isolate or purify the protein or for detection of protein or for detection of protein or function is useful in immunooff finity, and expected in the invention is beat table; is heat resistant, and is able to contain sample, and is and the contains and protein of the invention is heat table; is heat resistant, and is able to contain sample, and is also to contain sequence and regal activity after exposure to temperatures of from advantance protein of the invention of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          VKKDLAALMTDSQDWWPADYGHYGPFFIRMAWHSAGTYRIGDGRGGGGSGSQRFAPLNSW 137

a ROS-inductole promoter operably linked to a resporter gene that is heterologous to the promoter, and exposing the cell to a compound potentially abla to remove the ROS. The method is useful in determining the ability of a compound or gene product to remove a ROS and determining the level of the ROS HIZO laide a cell, to properly assess and abeliant the level of the ROS HIZO laide a cell, to properly assess and abeliance articolated may also be used in selecting for new or improved ROS citys. The method may also be used in selecting for new or improved ROS.
